

WALTON introduces Medicart Robot for ensuring isolation for COVID-19 patients

Walton, the country's leading tech company, has built a Medicart robot to safely deliver food, medicines and other essentials to Covid-19 patients in isolation. The company will hand over the Medicart robot, along with its remote control UV-C light disinfectant system, to the government's ICT division for clinical trial on Thursday.

Powered by a lithium ion battery, the robot can run uninterrupted for six hours on a full charge.

This robot can be used to treat isolated coronavirus patients or patients with other infectious diseases.
